

# Job Reporting using Mobile Apps

## RG Solutions

### RG Solutions

With twenty plus years of IT experience RG Solutions is now using Microsoft PowerApps and Microsoft Power Automate to deliver mobile solutions to Small Businesses with a mobile workforce.

### Microsoft PowerApps

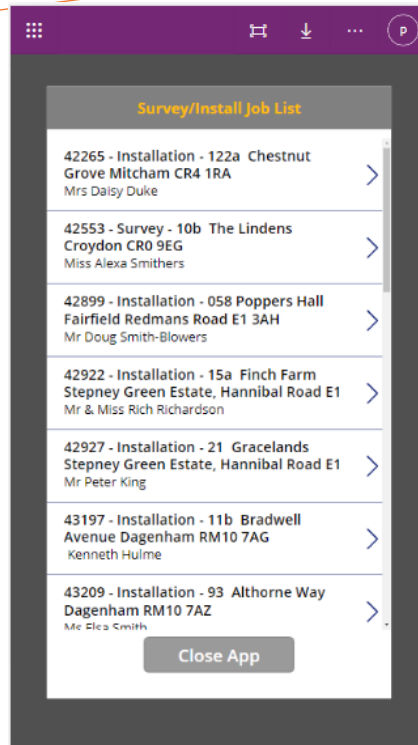

A 'Low Code' application development platform. Create mobile apps quickly and cost effectively for your business.

### Microsoft Power Automate

Create workflows within your organisation, automating repetitive tasks and linking data together using data connectors.

- Make use of functionality already available with Office 365 for Business
- Work with data from your existing systems including SQL, Excel, Access, Dynamics
- Get data back to base quickly and efficiently
- Capture data, pictures and signatures at site and send back to base

Included with Microsoft Office 365 is a technology called PowerApps and Power Automate. These technologies allow mobile apps to quickly be created using your Office 365 environment. Data stored in your existing databases (Access, SQL) and Excel sheets can be pushed out to your mobile workforce, and their input returned efficiently to base.

Example use

**Inspection Checklists** – Traditionally a job completion checklist would be ticked off on an A4 sheet of paper, and then be returned to central office at the end of the week. Now these can be returned electronically at the point of completion allowing the job to be closed off quicker.

**On Site, Off Site, Risk Assessments** – Add these types of forms to the App to get the data recorded back at the office for H&S recording and monitoring.

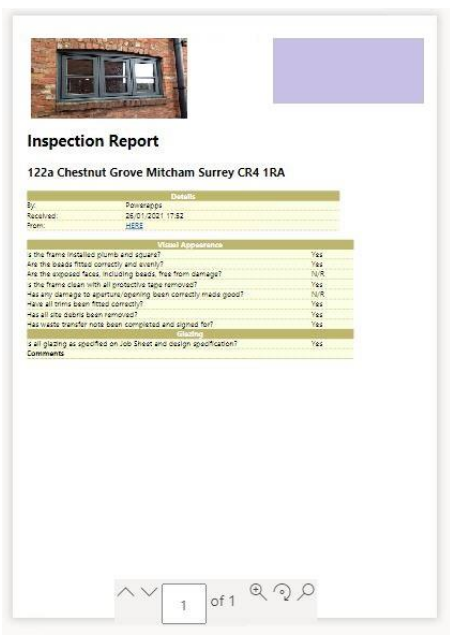

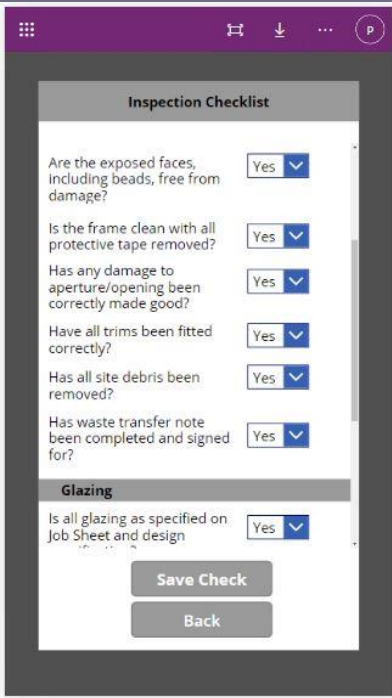

**Accident / Near Miss Reporting** – Record the details quickly and efficiently with the details emailed to the responsible person back at the office.

**Snagging Report** – A snagging or defect list may need some information recorded and some pictures taken. It can now be completed in a form and sent back to base where the appropriate person can receive the details in an email ready to action.

**Picture upload** – have pictures from base sent back to the office and automatically filed to the right place.

# Inspection Checklist

A scrolling screen containing your checklist where the user simply confirms the items have been checked before submitting. Resulting in a PDF document arriving back at base, automatically filed against the appropriate job. No more late or lost paperwork.

## How to Implement

If you have a mobile workforce and have invested in Office 365 then this offers a great opportunity to implement data capture 'on site' using licenses and technology you already have access to.

A great alternative to third party systems such as Alpha Tracker and iAuditor.

PowerApps can also be licensed separately from Office 365.

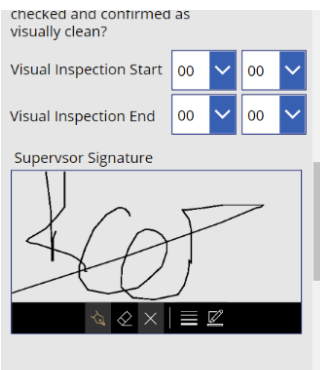

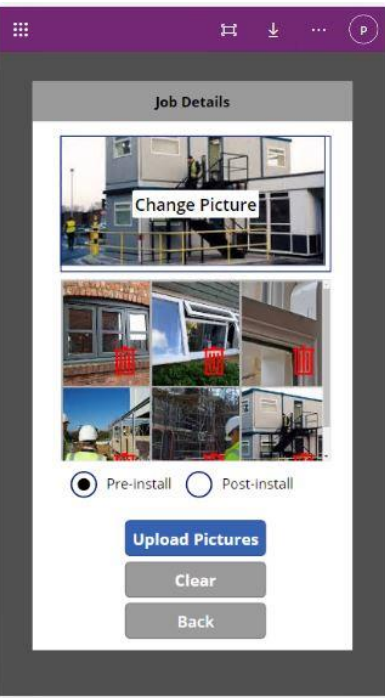

Contact us now for more information and demonstration.

## Other Services

We help you get the most from Office 365, support SQL and Access Databases, enhance Dynamics and Sharepoint based systems.

# Multiple Picture Upload

Allow multiple pictures to be sent back to base, arriving with a relevant filename and filed against the appropriate job. Remove manually handling images from your business processes.

# Signature capture

Capture signatures on screen and send back to base. Include these in your PDF documents.
